1 Index structure

2 Building instructions

Our system was deployed with: **Netbeans 8.0** and **Java 1.7.0_45**.
Building instructions should be similar to other versions of Netbeans.

1. We create a new Netbeans Java project by
File > New Project...> Java Project with Existing Sources
2. We name the project *Common* and the store location and press Next
3. We add the source folder located at the *Common* folder using Add
folder...
4. After the project is created, we import the *Stemmer* library located
at *Common*.

3 Running instructions
